ABSTRACT

Title:Amazon like commercial site cart data management platform

An web service system that permits a customer to submit online orders for items and/or services from a store that serves both walk-in customers and online customers. In commercial sites any one can buy a product and sell a product this are two users are available .buyer can search for product and customer can place order to buy a product for the site customer can also give rating for product and provided service. Once the customer decides to submit a purchase order, the customer may print the contents of the virtual shopping basket in order to obtain a hard copy record of the transaction. This project has 7 tables this tables describes how the user can select product and places a order and selling products.

a).AIM AND PRIORITY OF THE PROJECT:

To create a GUI based form for the project of **AMAZON LIKE COMMERCIAL SITE CART DATA MANAGEMENT PLATFORM**

Where the commercial site cart data management platform we can shop on this main objective of the Online Shopping System is to manage the details of Shopping,Internet,Payment, she Bills,Customer. It manages all the information about Shopping, Products, Customer, Shopping.

The values entered (insertion, updation, deletion)by the user for respective table in **GUI** should be updated in the database using **JDBC**.

b) REQUIREMENTS ANALYSIS

List of tables:

- Buyer
- Seller
- Sell
- Product
- Search

Table name	Attribute	Domain
1.Buyer	1.bid 2.bname 3.address 4.phoneno	varchar2(20) char(40) varchar2(50) number(10)
2. Seller	1.Sid 2.Sname 3.Rating	varchar2(20) char (50) number(10)
3.Sell	1.Sid 2.Pid 3.Date of join	varchar2(10) char(20) Date
4.Product	1.Pid 2.Pname 3.product description	varchar2(30) char(30) varchar2(50)
4.Search	1.Pid 2.Bid	Varchar2(30) Varchar2(20)

c)Architecture and Technology used

Java Eclipse, Oracle 11g Database, java SE version 8, SQL *plus ,java AWT

Eclipse: It is an integrated development environment (IDE) used in computer programming. It contains a base workspace and an extensible plug in system for customizing the environment. The Eclipse software

development kit (SDK), which include java development tools is meant for java developers.

SQL *plus: SQL *plus is a command line tool proprietary to oracle. You can send SQL Queries to the server using the tool. It can also help you format the result of query. SQL is the query language that is used to communicate with the oracle server to access and modify data.

JAVA AWT: Abstract window tool kit is an API to develop GUI or Window based applications in java. Java AWT components are platform dependent i.e components are displayed according to the view of operating system. AWT is heavy weight that is components are using the resources of O.S.

JDBC: Java Database Connectivity is an application programming interface (API) for the programming language java ,which defines how a client may access database. It is a javabased data access technology used.

d) Data Base Design

Entity Relationship Diagram

k.kusuma

1602-18-737-312

ER Diagram:

e) Implementation

i) Front end programs and its connectivity.

```
public void connectToDB()
{
    try
    {
        connection =
DriverManager.getConnection("jdbc:oracle:thin:@localhost:1521:xe","kusuma","vasavi");

        statement = connection.createStatement();

        statement.executeUpdate("commit");

    }
    catch (SQLException connectException)
    {
        System.out.println(connectException.getMessage());
        System.out.println(connectException.getSQLState());
        System.out.println(connectException.getErrorCode());
        System.exit(1);
    }
}
```

Here, the connection from Java to Oracle database is performed and therefore, can be used for inserting, updating and deleting tables in the database directly.

Title: Amazon like commercial site cart data management platform

Table Created in SQL for above mentioned purpose is as:

Create table Buyer(

bid number(10) primary key, bname varchar(20),phoneno number(11),address varchar2(30));

PROGRAM:

1)AddBuyer

```
package Buyer;

import java.awt.Button;

import java.awt.GridLayout;

import java.awt.Label;

import java.awt.Panel;

import java.awt.TextArea;

import java.awt.TextField;

import java.awt.event.ActionEvent;

import java.awt.event.ActionListener;

import java.sql.Connection;

import java.sql.DriverManager;

import java.sql.SQLException;

import java.sql.Statement;
```

```
public class AddBuyer extends Panel
```

```
{
```

```
    /**
```

```
    *
```

```
    */
```

Title: Amazon like commercial site cart data management platform

DISCUSSION & FUTURE WORK :

The application done till now is basically to store the details of commercial site which means through this site any one can place the order and few people can sell their product through this site buyer can search for different product and they can place order they can buy the products for this number of entities and relationship between them will come into picture, which can be converted into first tables using SQL commands and then into GUI program using java code.
